

For project 2, I wanted to create a simple game that kids could easily play and use. I thought that it would be a good idea to create a 3 cups and 1 ball app. The ball would go inside the one of the cups and all of the cups will mix up and then eventually stop. The user will then pick a cup and if they get it right then it will give them points, but if they get it wrong then they will lose points. Mostly kids will be using my app and it will solve the problem of boredom. Kids become bored very easily and they are always looking for something to entertain them. There are other apps like this, but my scoring system will be different and my illustrations will also be different.

If there is enough time, my app will also have some other interactivity as well such as being able to change the colors of the cups and ball. After my research, creating this app is possible. I will need to look at the syntax for creating animations, but there are many online resources with this available. I will also create any illustrations needed using Adobe Illustrator.

Ballo and Cups
